Engineering Coding Standards

1. Code Review

Every change must go through a pull request with at least one approving reviewer. Reviewers should respond within one business day. Self-approval is not permitted, and administrators cannot bypass review for production branches.

2. Branch Naming

Branches must follow the pattern feat/, fix/, or chore/. Direct pushes to main and release branches are blocked by branch protection. Squash merge is the default merge strategy.

3. Commit Messages

Commits must follow the Conventional Commits format, for example feat(auth): add refresh token rotation. Each commit should be atomic and compile on its own.

4. Testing Requirements

New business logic requires unit tests with at least 80 percent line coverage for the changed files. Integration tests are required for any change touching the payment or authentication modules.

5. Formatting and Linting

Python code is formatted with ruff format and linted with ruff check. Type hints are required on all public functions. CI fails on any lint error or failing test, and merging is blocked until CI is green.
